

JORDAN ROBISON

SENIOR CLOUD SECURITY & DEVSECOPS ENGINEER

UNITED STATES | APPLICATION CONTACT DETAILS PROVIDED THROUGH EMPLOYER ATS

PROFESSIONAL SUMMARY

Senior security and infrastructure engineer with 10+ years spanning cloud engineering, SRE, application security, DevSecOps, and regulated SaaS operations. Hands-on across AWS, GCP, Linux, Kubernetes, Docker, Terraform, Ansible, CI/CD security, IAM, vulnerability management, observability, and security automation. Experienced translating FedRAMP, NIST 800-53, PCI DSS, ISO 27001, and HIPAA requirements into practical engineering controls, evidence, remediation work, and secure delivery patterns. Strong Python, Go, and Bash automation background with a track record of owning ambiguous production and security problems from investigation through root cause and durable remediation.

CLOUD SECURITY & DEVSECOPS ECOSYSTEM

Cloud & Platform Security: AWS, GCP, Linux, Windows Server, Kubernetes, Docker, IAM, networking, workload security, secure cloud architecture

DevSecOps & Delivery: GitHub Actions, Jenkins, CI/CD pipeline security, Terraform, Ansible, Infrastructure as Code, policy/security gates, secure SDLC

Application Security: SAST, DAST, SCA, IaC scanning, secrets detection, SBOM, container scanning, threat modeling, architecture review, secure code review

Security Operations: CSPM, SIEM/log analysis, cloud threat detection, vulnerability management, incident response, root cause analysis, remediation patterns

Vulnerability Focus: Injection, authentication/authorization weaknesses, broken access control, SSRF, XSS, secrets exposure, software supply-chain risk

Compliance & Governance: FedRAMP, NIST 800-53, RMF concepts, PCI DSS, ISO 27001, HIPAA, audit evidence, control mapping, regulated environments

Automation & Observability: Python, Go, Bash, REST APIs, JSON/YAML, LogicMonitor, Prometheus, Grafana, metrics, logs, telemetry, alerting

PROFESSIONAL EXPERIENCE

FedRAMP Technical Support Engineer | LogicMonitor Jun 2024 - Present

- Own complex technical investigations for a SaaS observability platform operating in a regulated FedRAMP environment, spanning distributed collectors, cloud integrations, networking, APIs, authentication, and Linux/Windows systems.
- Reproduce failures, analyze logs and telemetry, isolate root causes, and convert findings into engineering escalations, customer-ready explanations, diagnostic procedures, and reusable runbooks.
- Troubleshoot security- and reliability-adjacent issues involving permissions, firewalls, proxies, certificates, endpoint behavior, SNMP/WMI, cloud services, and monitoring integrations.
- Support NIST 800-53 control documentation, audit evidence, secure handling expectations, and disciplined operational processes for federal and other regulated customers.

Senior Application Security Engineer | Commure Jan 2023 - Nov 2023

- Embedded security into software delivery by engineering GitHub Actions workflows for source code, dependency, container, secrets, and infrastructure-as-code scanning.
- Performed threat modeling, secure architecture reviews, secure code review, vulnerability analysis, and security design guidance for healthcare software and cloud-native services.
- Partnered directly with engineering teams to prioritize findings, reduce false positives, improve developer feedback loops, and convert security requirements into practical remediation work.
- Developed repeatable response playbooks and risk narratives connecting exploitability and technical findings to business impact and compliance expectations.

Senior Security Cloud Engineer | Stax Payments Jun 2021 - Jan 2023

- Designed and implemented reusable AWS security controls with Terraform and Ansible, improving consistency, auditability, and secure-by-default cloud provisioning.
- Hardened Kubernetes and Docker environments; strengthened IAM, workload monitoring, vulnerability management, logging, cloud threat detection, and least-privilege patterns across payment systems.
- Led technical risk work supporting PCI DSS and ISO 27001, translating control objectives into architecture, configuration, evidence, and remediation requirements.
- Mentored engineers on cloud security architecture, infrastructure as code, secure networking, incident response, and operational ownership.

Senior Software Engineer / DevOps & Reliability | WellSky Jul 2020 - Oct 2021

- Automated AWS and Linux deployment, configuration, and reliability workflows for healthcare applications, including containerized .NET services and CI/CD pipelines.
- Reduced deployment time by 50% through repeatable automation, standardized environments, and improved release processes.
- Improved observability, troubleshooting, and production stability by connecting application behavior, infrastructure telemetry, and operational runbooks.

Senior Cloud Operations Engineer | 2nd Watch 2019 - 2020

- Supported production AWS environments for enterprise customers using automation, monitoring, incident response, and operational best practices to improve availability and security.
- Troubleshoot complex cloud, Linux, networking, permissions, and deployment issues across customer, operations, and engineering teams.

Infrastructure Systems Engineer / Site Reliability Engineer | Samba TV 2018 - 2019

- Operated and improved Linux-based infrastructure and data platform services with emphasis on reliability, monitoring, automation, capacity, and rapid incident resolution.
- Built practical tooling and operational processes that reduced manual work and made distributed production systems easier to support and diagnose.

Cloud Systems Engineer | ClearDATA 2016 - 2017

- Engineered and supported secure AWS/Linux environments for healthcare workloads, including monitoring, automation, access controls, troubleshooting, and compliance-aligned operations.
- Worked across infrastructure, security, and customer requirements to maintain dependable cloud systems in a highly regulated industry.

ADDITIONAL QUALIFICATIONS

Cross-Functional Security: Cloud security, application security, DevSecOps, infrastructure security, SRE, automation, vulnerability management, and compliance.

Engineering Approach: Builds practical controls and automation that connect developers, platform teams, security operations, and compliance without creating unnecessary delivery friction.

Regulated Environments: Federal/FedRAMP, healthcare, fintech/payments, and enterprise SaaS.

CERTIFICATION

CompTIA Security+
